TAOS

Therapeutic Ambulatory Orthotic System

The Taos is a revolutionary system designed for children with neuromotor impairments such as Cerebral Palsy. A custom orthotic is the core of the system, providing proper alignment and control of the torso and lower limbs. For children who have balance or strength issues, the orthotic can be combined with a mobility base to enable children to engage in upright, hands free weight bearing activities without fear of falling. A wide range of activities can be enjoyed while in the Taos. It is designed to be used daily in the home or at school, indoors or out, to supplement the physical therapy these children receive. The more activity in the Taos the greater the benefits.

The Taos provides many things for children

- Enables children to experience a newfound freedom and sense of accomplishment
- Custom fabricated orthotic ensures proper alignment and support individualized to each child (weight bearing and ambulation occurs with joints properly aligned)
- System allows for partial to full weight bearing
- Easily adjustable height
- Sit to stand mechanism enables children to be lowered to a sitting position while still attached to the mobility base
- Two years of growth adjustments
- Hands free system
- Enables a variety of activities for children who can't function independently in posterior walkers
- Provides an environment for exercise and strengthening of neck and trunk muscles along with ambulation
- Covered by most insurance providers and Medicaid.
